

# DIY - Build your Own Cloud

Bhavin Hingu

SME – Oracle (Database / Clustering / Cloud Control)

[www.OracleArchitect.com](http://www.OracleArchitect.com)

---

Hello friends, I am sharing my experience of building robust fully functional personal Cloud System at home that is fully accessible and manageable remotely. After successful completion of design/architecture and implementation, I am able to spin up Linux guest VMs from the gold image and access them remotely as needed without any issues. Further, I am using the Automation to create the guest VMs and install the Oracle software as part of the single build. Fun stuff...!!!

Technical knowledge and hands on experience in below area is desired:

- VM software (for e.g., Oracle VM VirtualBox)
- Network (basic to mid-level)
- Storage – NAS (basic knowledge)
- Linux administration (mid to advanced level)
- Programming/scripting knowledge.

## The Goal:

My goal was to build robust and fully functional Cloud at home which can be accessible remotely any time I want. I needed to create multiple guest VMs to install and run the Oracle Enterprise software for practice and learning purposes. I also needed to back them up periodically. Since the guest VMs are VDI files on VM host, backing them up, restoring them or migrating them to different VM host is much easier as compared to the set up that I had earlier where I was using the physical boxes in my lab. I also thought of an option to lease Virtual Private Cloud from AWS but I chose BWS (Bhavin Web Services. .hehe) over AWS just because I can proudly say I use my own homegrown Cloud system 😊.

## Design towards the Goal:

VM Host Consideration (Machine where Hypervisor gets installed):

Because I required to create about 12 to 14 guest VMs to run multiple Oracle software installs (like Grid Infrastructure, Oracle RAC Databases, GoldenGate, Oracle EBS, Oracle Utilities, Oracle OEM Cloud Control etc. etc.),

I decided to look for a machine that has at least 32 Cores and 128GB RAM. After doing some research, I decided to buy the Dell Precision T7610 (refurbished) that has 32 cores 128GB RAM with 250GB SSD and 2TB spindle storage HD and most importantly fit in my budget. 😊

Storage Consideration:

To store the guest VMs, I decided to use the 2TB of local storage that came with the machine itself. But I also used my existing Western Digital's MyCloud 24TB NAS Storage

for backing up of my Cloud VMs and other Cloud related files. I created the sharable NFS volume on NAS of about 1TB in size and mounted it on the VM host.

### Network Consideration:

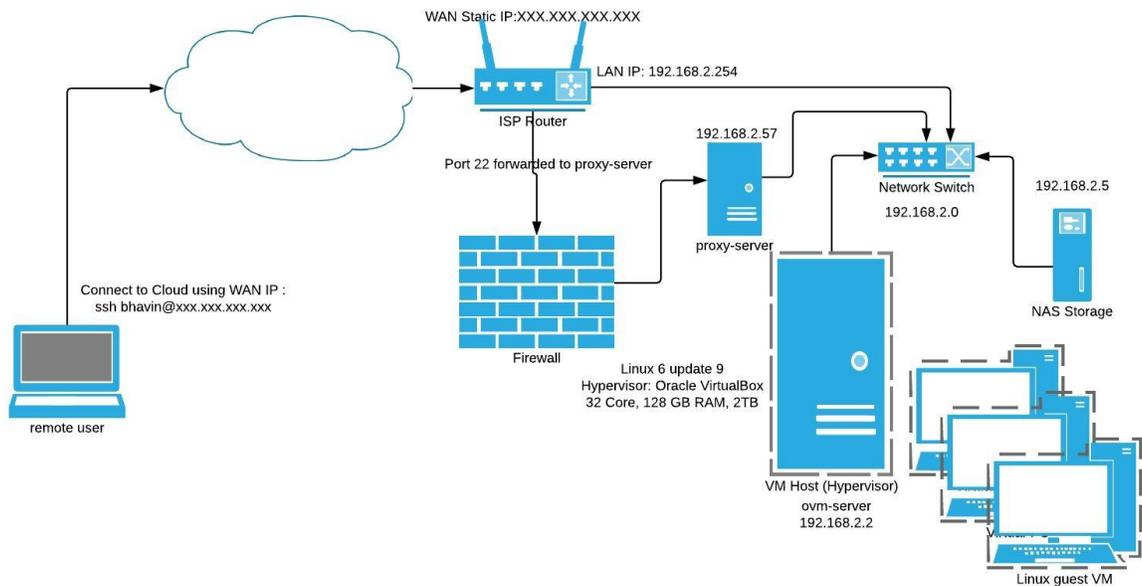

Here I required to setup the LAN for NAS storage, VM Host and the Proxy server so that they all can connect to the ISP router. So, I needed the Network Switch for the connectivity,

### Proxy Server Consideration:

To access the Cloud system remotely, I simply used the DMZ setup in the ISP supplied router to forward certain ports like ssh/VNC etc. to a proxy server which is nothing but a Linux machine that is connected to the same LAN as VM Hosts, guest VMs and other IOT at home. I wanted to have a server that act as a proxy machine for all the remote connection requests from outside network primarily for the security reason. The need of proxy machine in this setup is not mandatory. One could also configure ISP router to forward the required ports directly to any of the guest VMs or VM Host itself for that matter and would still work.

After considering all of the above points, I came up with the below design / Architecture of my Cloud

Infrastructure / Network Diagram of the Cloud System at home.

### Hardware Used:

#### Network:

Network Switch – 1 (D-Link 24-Port Rackmountable Gigabit Switch)  
Network Cables - 5

Cost: roughly \$200

#### Storage:

2TB of Local storage on the Hypervisor / VM Host.  
24TB NAS from WD's MyCloud PR4100 for Backup  
Cost: \$1500

#### VM Server:

Dell Precision T7610 Workstation (32 Core/ 128GB RAM/ 250GB SSD / 2TB spindle  
HD - refurbished

Cost: \$2300

#### Proxy Server:

Dell 8GB RAM /250GB HD  
Cost: \$400

*Total Cost to build the Cloud Infrastructure: \$4500*

#### **Software Used:**

- Oracle Linux 6 update 9 (downloaded on DVD from [otn.oracle.com](http://otn.oracle.com))
- Oracle VM VirtualBox 5.2
- VNC Viewer (for Xwindows / X Desktop)

## **Technical Steps / implementation of the Design:**

Here are the steps that I had to complete successfully in order to build the Cloud Infrastructure as per the design.

- Update the LAN setting in the ISP Router.
- Install Linux on the VM Host and Proxy Server
- Connect the devices to the network
- Stage the required software/downloads.
- Install Oracle VM VirtualBox Hypervisor on the VM Host.
- Create the Guest VMs.
- Start the Guest VMs

- Setup the Backup Server for these VMs.
- Accessing the Cloud System remotely.

## Change the ISP router's default setting:

I decided to start with changing the ISP's default network setting in the router to my own custom setting as shown in the screenshot below. All the subsequent devices that would connect will have a network of 192.168.2.0. I could have used the default router setting and would still work fine.

192.168.2.254

Home Services **Settings** Site Map

System Info Broadband **LAN** Firewall Logs Diagnostics

Status Wi-Fi Wired Interfaces DHCP LAN IP Address Allocation Statistics IPv6

### Private Network

**Router/Gateway Address** 192.168.2.254  
**Subnet Mask** 255.255.255.0

**Private Network DHCP Info**

Range	192.168.2.1 - 192.168.2.253
Allocated	31
Remaining	222
Timeout	59940 minutes

### IPv6 Status

Type	Value
LAN Status	Up
Link Local Address	[REDACTED]
Delegated Address	[REDACTED]

### Interfaces

Interface	Status	Active Devices	Inactive Devices
Ethernet	Enabled	11	5
HomePNA	Enabled	0	0
5GHz Wi-Fi	Enabled	4	2
2.4GHz Wi-Fi	Enabled	8	2

## Install Linux:

Install Linux OS on the machine that is going to be the VM host machine

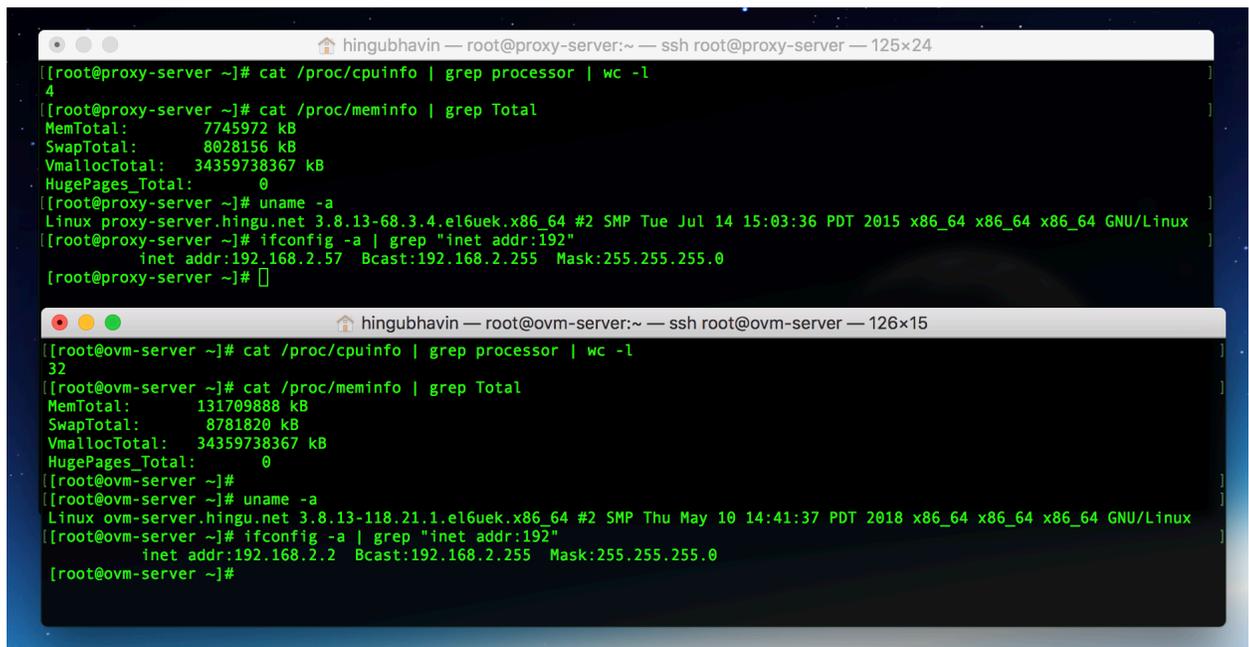

Host Name: ovm-server.hingu.net

eth0: 192.168.2.2/255.255.255.0/192.168.2.254 Gateway

Install Linux OS on Proxy Server:

Hostname: proxy-server.hingu.net

eth0: 192.168.2.57/255.255.255.0/192.168.2.254 Gateway.

```
hingubhavin — root@proxy-server:~ — ssh root@proxy-server — 125x24
[[root@proxy-server ~]# cat /proc/cpuinfo | grep processor | wc -l
4
[[root@proxy-server ~]# cat /proc/meminfo | grep Total
MemTotal:      7745972 kB
SwapTotal:     8028156 kB

```

## Connect the devices to the LAN Network via Switch:

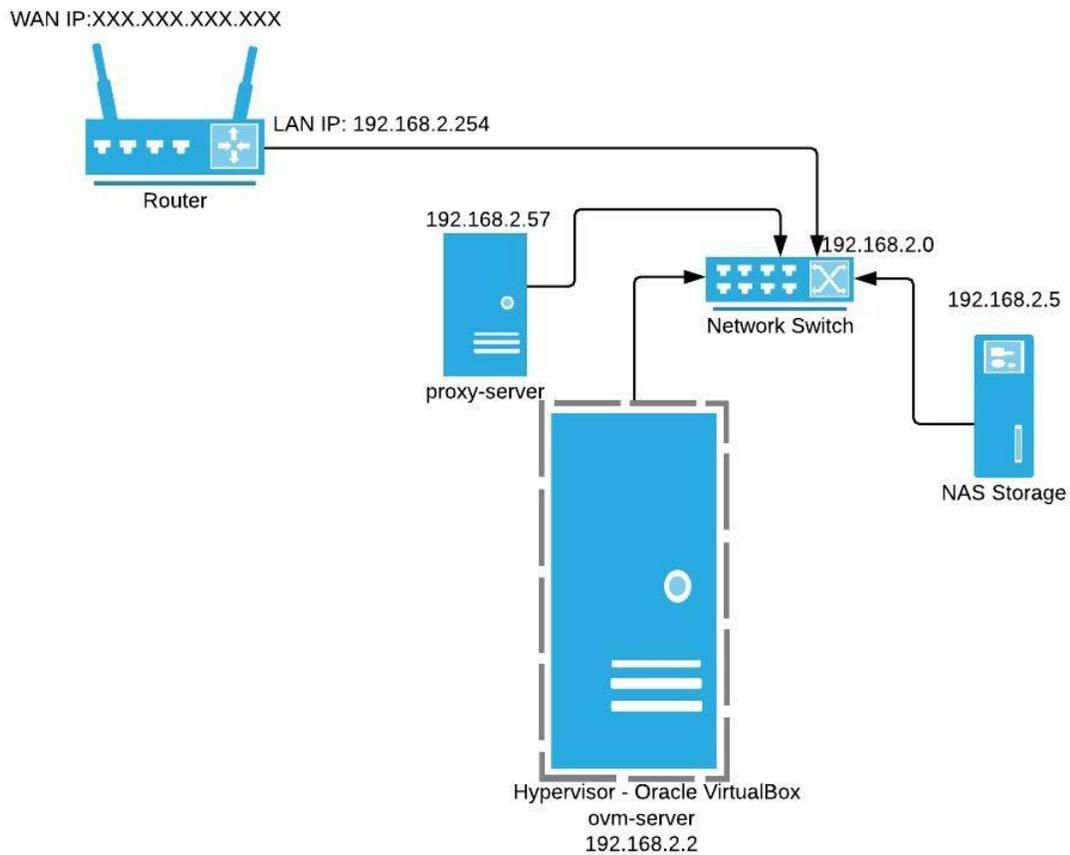

At this point I was ready to connect the below devices to the LAN Network Switch.

ISP router

Linux Machine – Proxy Server (proxy-server.hingu.net)

Linux Machine – VM Host (ovm-server.hingu.net)

WD's MyCloud NAS Storage – (MyCloudPR4100 - Pre-configured by WD).

## Preparing the Storage for the Guest VMs:

I wanted to utilize the 2TB of secondary storage hard drive that came with the machine to store all the guest VMs. For that, I had to first formatted it with ext4 since it was ntfs originally.

```
parted /dev/sda mklabel msdos
parted -a opt /dev/sda mkpart primary ext4 0% 100%
mkfs.ext4 -L data /dev/sda1
```

```
mkdir /u01
mount -o defaults /dev/sda1 /u01
```

put the entry in the /etc/fstab so that it gets auto mounted during startup. Created the directory under this mount to store the guest VMs.

```
mkdir /u01/guestVMs
```

```
hingubhavin — root@ovm-server:~ — ssh root@ovm-server — 103x36
[root@ovm-server ~]# cat /etc/fstab
#
# /etc/fstab
# Created by anaconda on Fri May 18 03:06:02 2018
#

[root@ovm-server ~]#
```

## Stage the required downloads:

Created the staging area to store the ISO images of the Linux that I used in creating the guest VMs. I also downloaded the Oracle software like Grid Infrastructure, Oracle Database, etc.

```
mkdir -p /u01/software/linux
mkdir -p /u01/software/oracle
```

Downloaded the listed software from oracle's site:  
<http://www.oracle.com/technetwork/indexes/downloads/index.html>

```
hingubhavin — root@ovm-server:~ — ssh root@192.168.1.107 — 81x24
[root@ovm-server ~]#
[root@ovm-server ~]# ls -ltr /u01/software/linux/
total 3953668

```

## Install Oracle VM VirtualBox on the VM Host (ovm-server):

Below is the Oracle VM VirtualBox document Link that I followed to successfully Install and configure the Oracle VM VirtualBox on the VM host (ovm-server).

<http://www.oracle.com/technetwork/server-storage/virtualbox/documentation/index.html>

```
yum install VirtualBox-5.2
yum list VirtualBox-5.2
```

## Create the guest VMs

I created the first guest VM manually using GUI very first time which I then provisioned it for as per the requirement of Oracle Install (applied all the kernel settings/updates/RPMs/user group creation etc etc).

Then, I used this gold build to create all the subsequent VMs through the cloning. I used the /u01 mount that I created earlier for the storage of VM specific files (VDI) files.

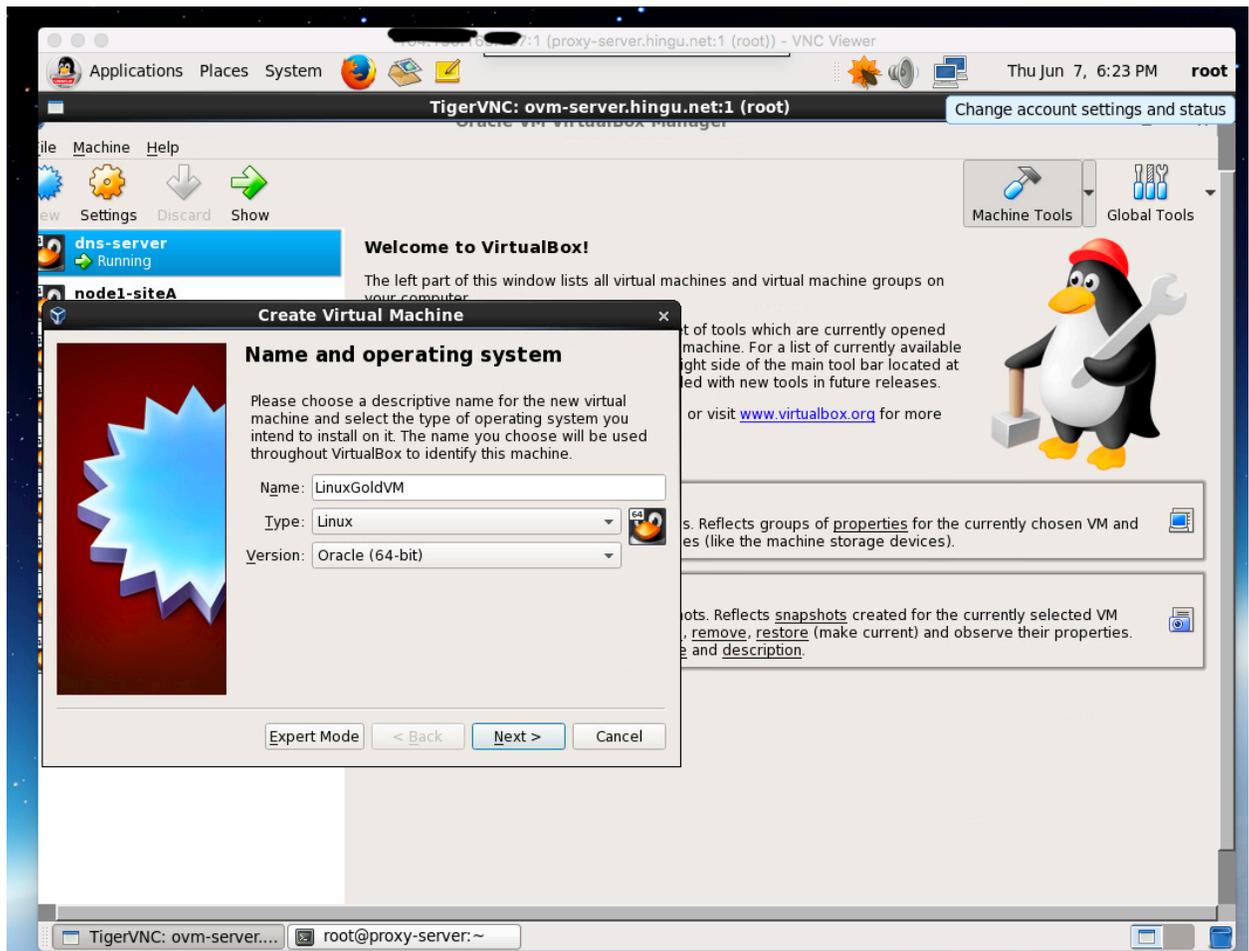

```
mkdir /u01/guestVMs/node
```

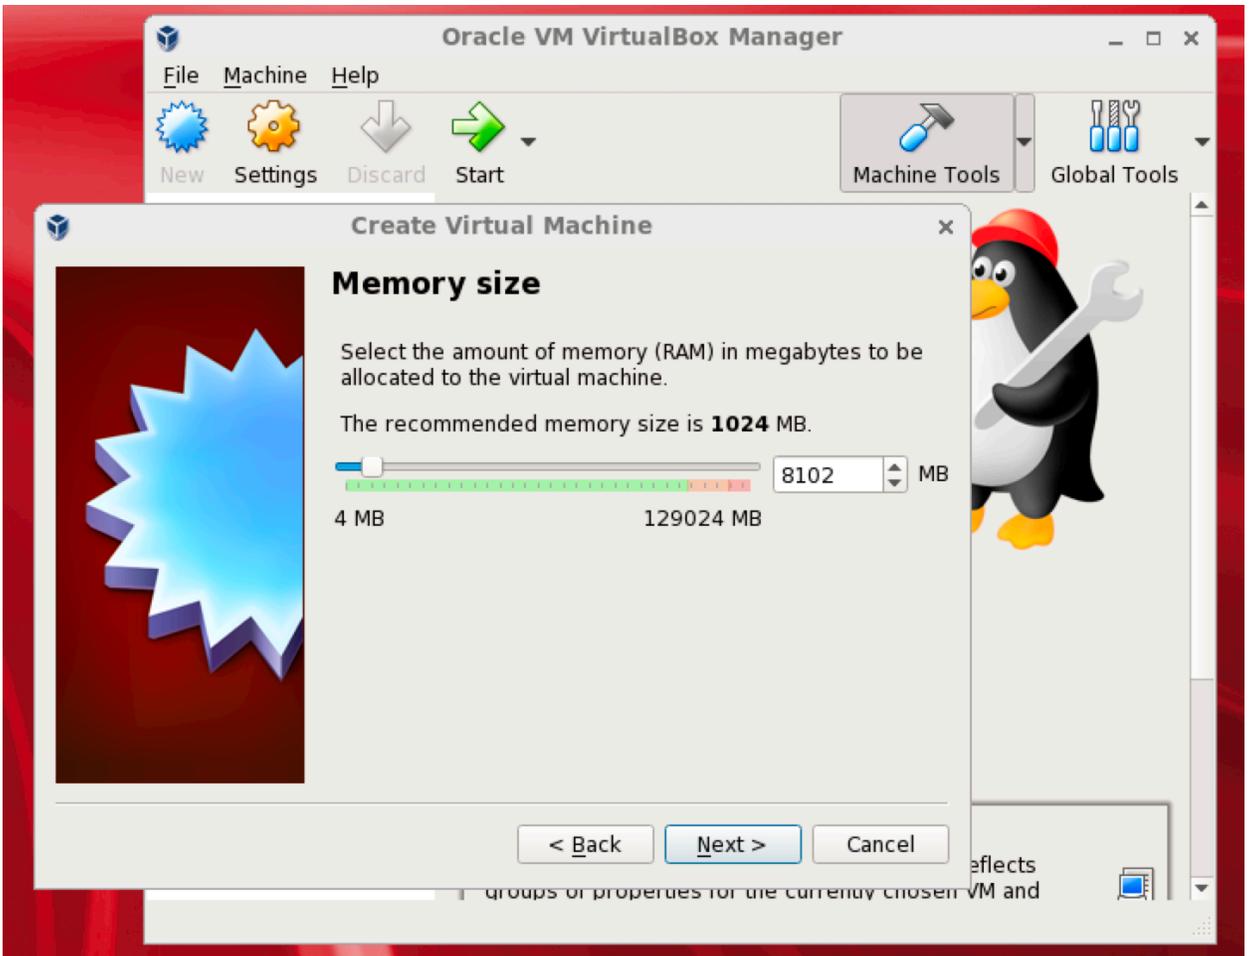

Here is the sample example of the process that I followed to create the guest VM manually.

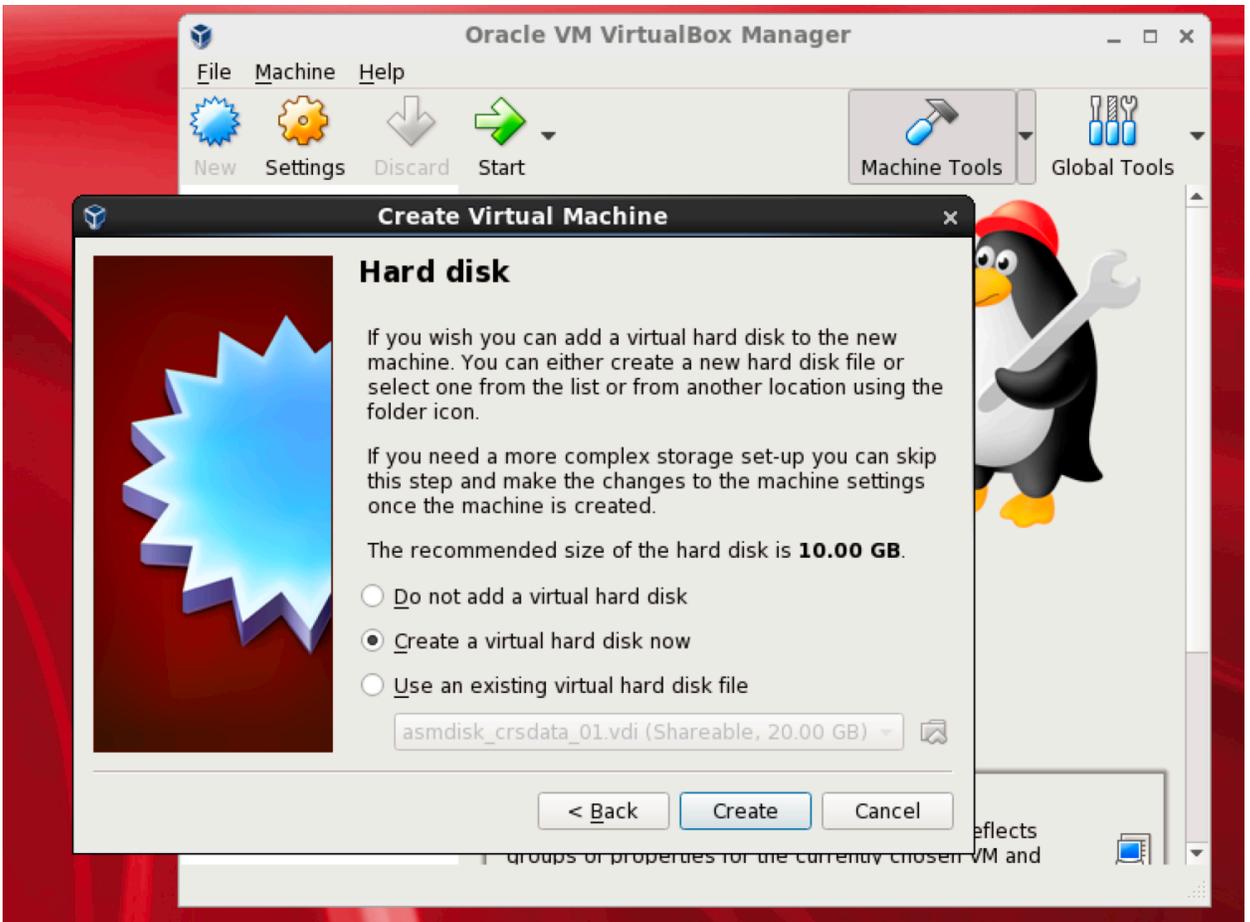

Using X terminal, I started the VirtualBox as root and followed the instructions on the screen to create the guest VM. The instructions on screens are very straight forward. It asks for inputs like type of OS, Virtual Hard Disk, Memory, CPU, type of Network etc. As I wanted to access the VMs from any of the computer within the network, I decided to use the “Bridged Adaptor” instead of Host-Based / NAT Adaptor

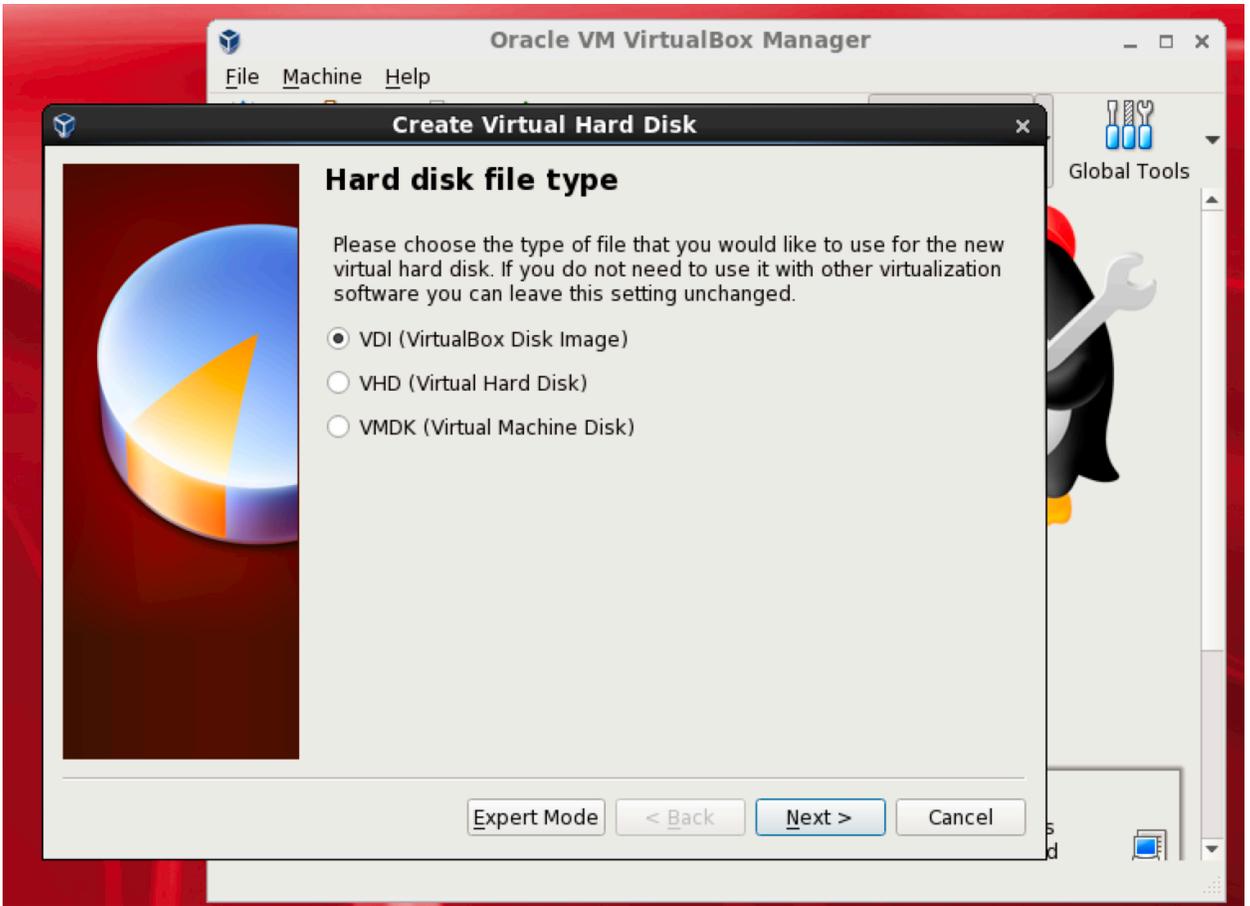

Start the VirtualBox as root by executing below command:

VirtualBox &

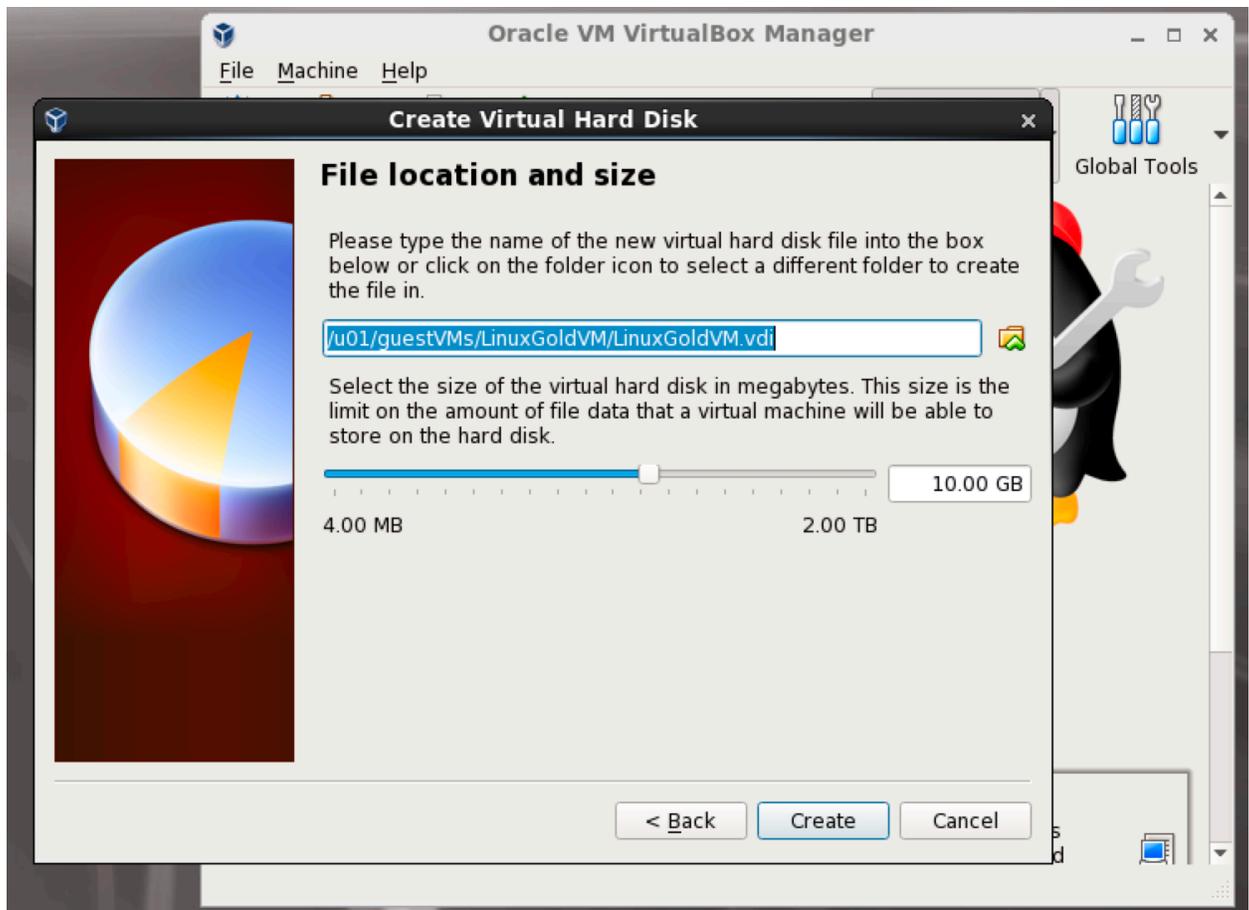

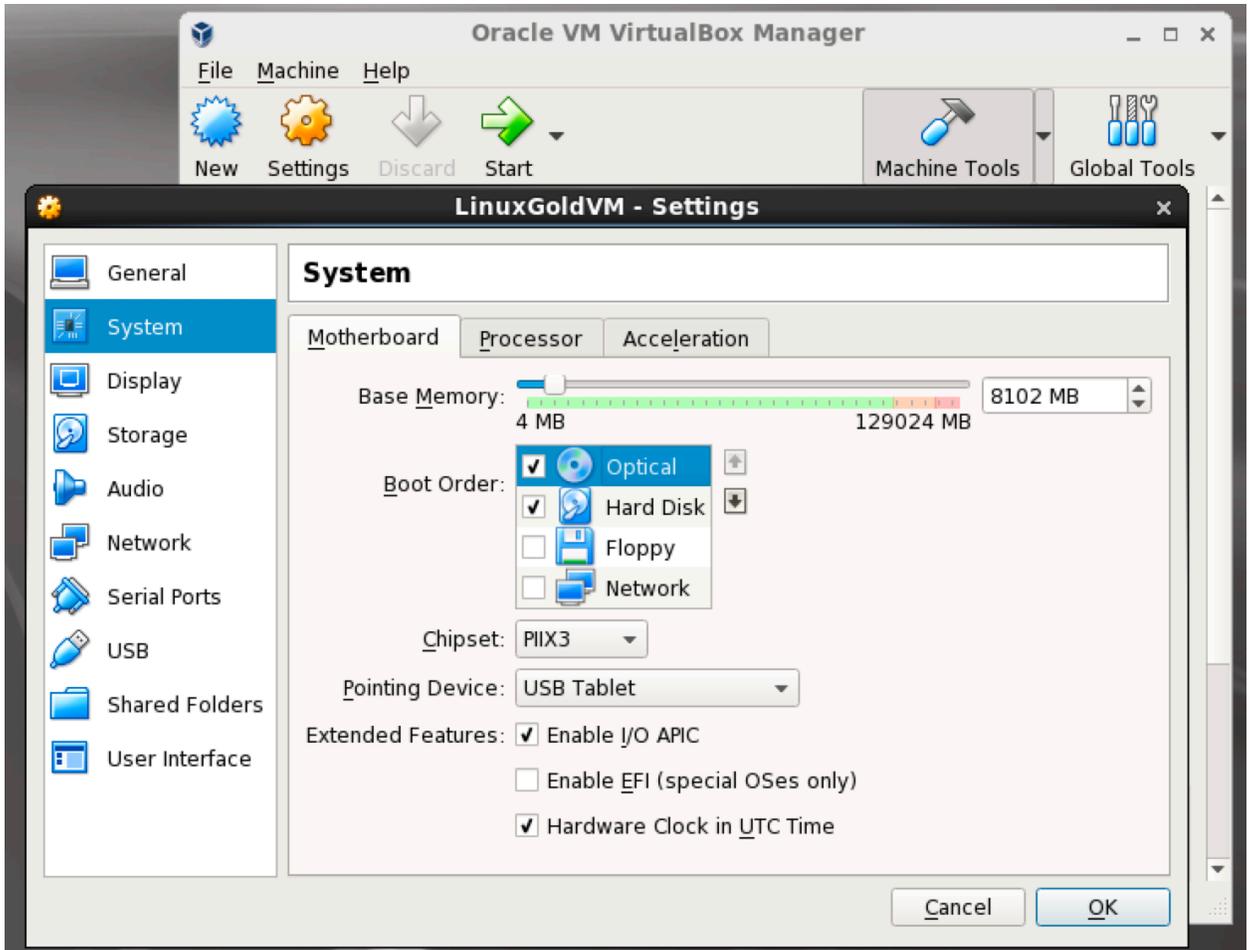

Here I make sure to change the path of the VM file to the /u01 mount that I created specifically to store the guest VMs.

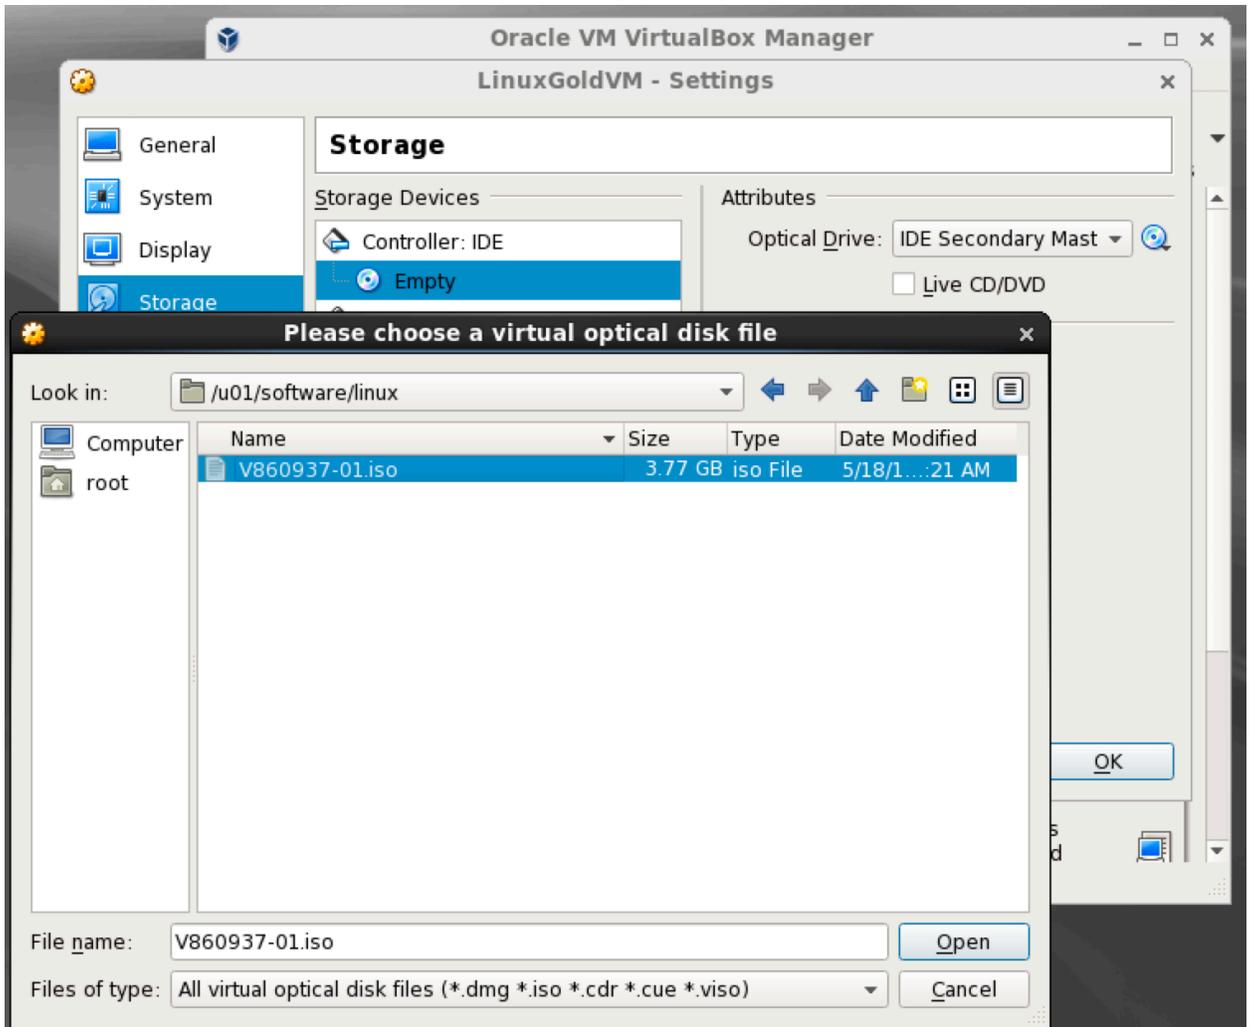

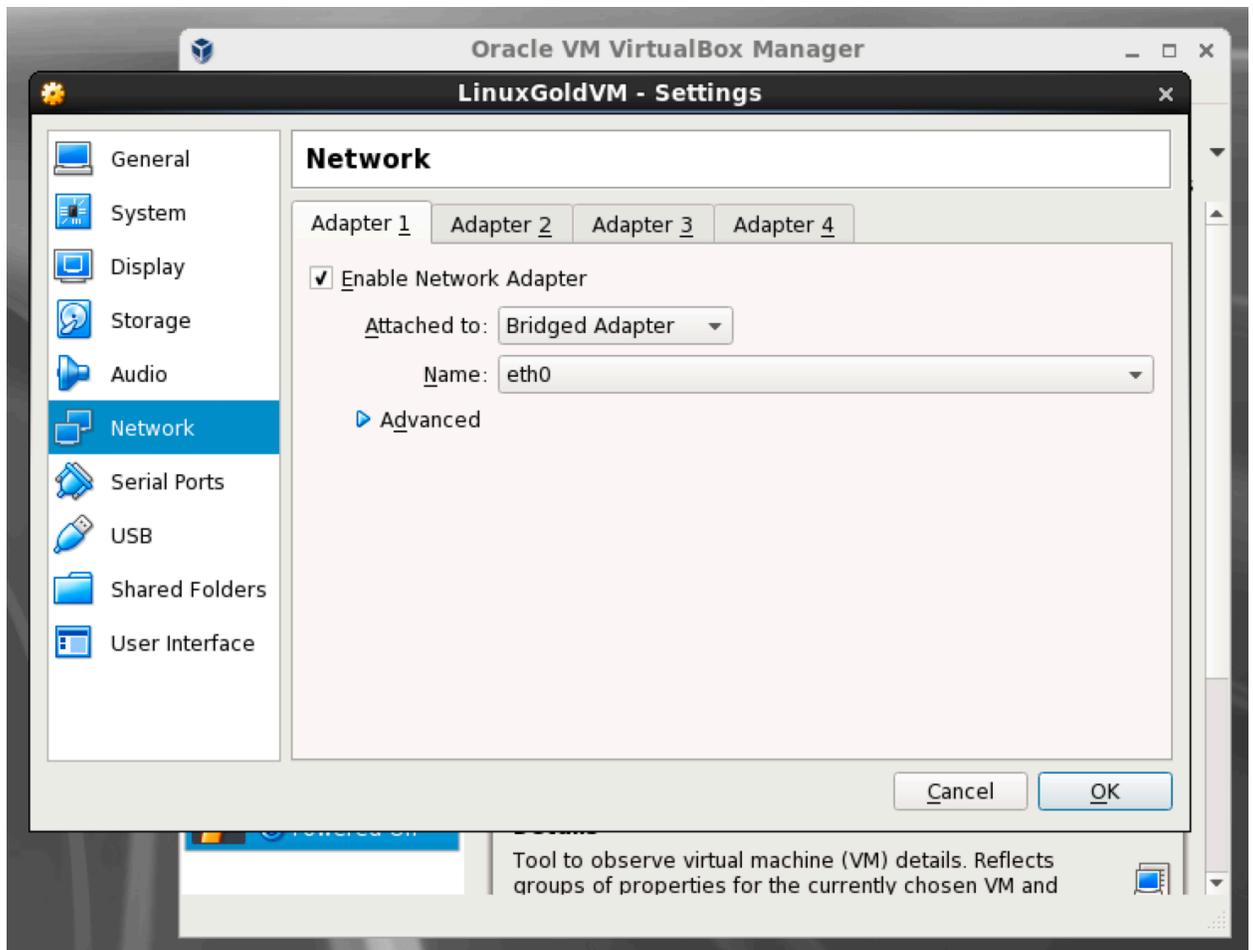

Once the guest VM template is created, click on "Settings" to change the System / Storage and Network values as shown in the next series of screenshots.

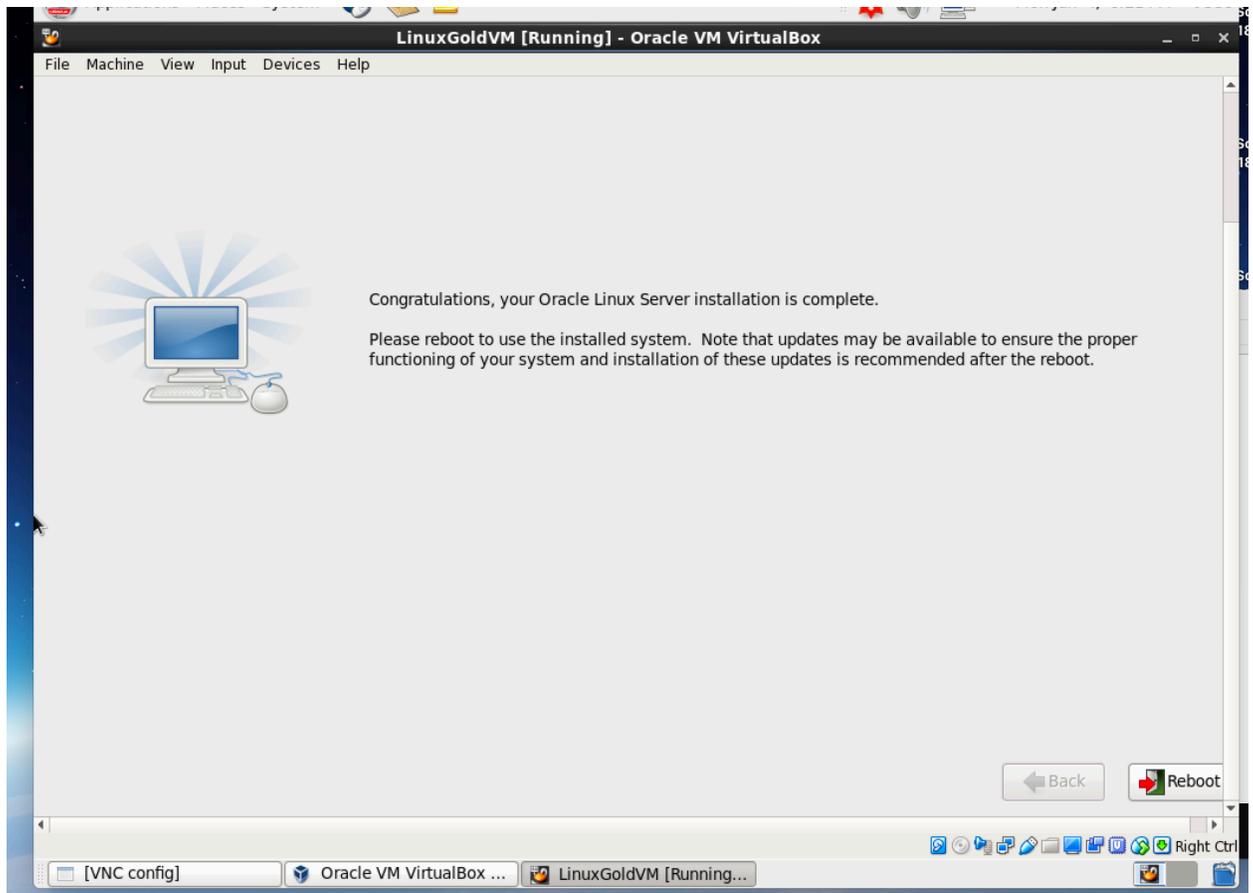

At this Point, I was ready to Click the “Start” button on the VirtualBox main window to install the Oracle Linux OS. I simply followed the standard process of installing Linux OS depending on what software its going to host.

```

### **Install the guestAdditions in the guest VM:**

Power off the VM:

```
VBoxManage controlvm 'LinuxGoldVM' poweroff
```

Mount the VBoxGuestAdditions.iso :

This file is located under `/usr/share/virtualbox` on the VM Host (ovm-server)

Power On the VM and mount the Virtual Disk under /media:

```
nohup /usr/bin/VBoxHeadless -startvm "LinuxGoldVM" &  
mount -t iso9660 /dev/sr0 /media
```

Install the prerequisite RPMs:

```
yum install kernel-uek-devel  
yum install kernel-uek-devel-`uname -r`  
yum install kernel-headers  
yum install kernel-devel
```

Execute the VBoxLinuxAdditions.run file:

```
cd /media
```

./VBoxLinuxAdditions.run

```
[root@LinuxGoldVm media]# ./VBoxLinuxAdditions.run

[[root@ovm-server ~]# □
```

The guest VM gets internet connection via ISP Router's default gateway (192.168.2.254) defined in the /etc/resolv.conf file. This file also contains my private DNS to resolve other VMs within the LAN "hingu.net" domain. I define the DNS1 and DNS2 in the ifcfg-eth0 file (NIC for public network) in each VM from where the Network Manager in Linux picks the Value of these DNSs and update the /etc/resolve.net during the startup of network services.

```
hingubhavin — root@node1-siteA:~ — ssh root@104[redacted] — 80x27
[root@proxy-server ~]#
[root@proxy-server ~]# ssh node1-siteA
root@node1-siteA's password:
Last login: Fri Jun  8 05:30:49 2018 from 192.168.2.2
[root@node1-siteA ~]# cat /etc/resolv.conf
# Generated by NetworkManager
search hingu.net
nameserver 192.168.2.15
nameserver 192.168.2.254
[root@node1-siteA ~]# nslookup proxy-server.hingu.net
Server:          192.168.2.15
Address:         192.168.2.15#53

Name:   proxy-server.hingu.net
Address: 192.168.2.57

[root@node1-siteA ~]# ping google.com
PING google.com (172.217.1.238) 56(84) bytes of data:

rtt min/avg/max/mdev = 4.973/5.435/5.898/0.468 ms
[root@node1-siteA ~]#
```

## Clone the Gold image:

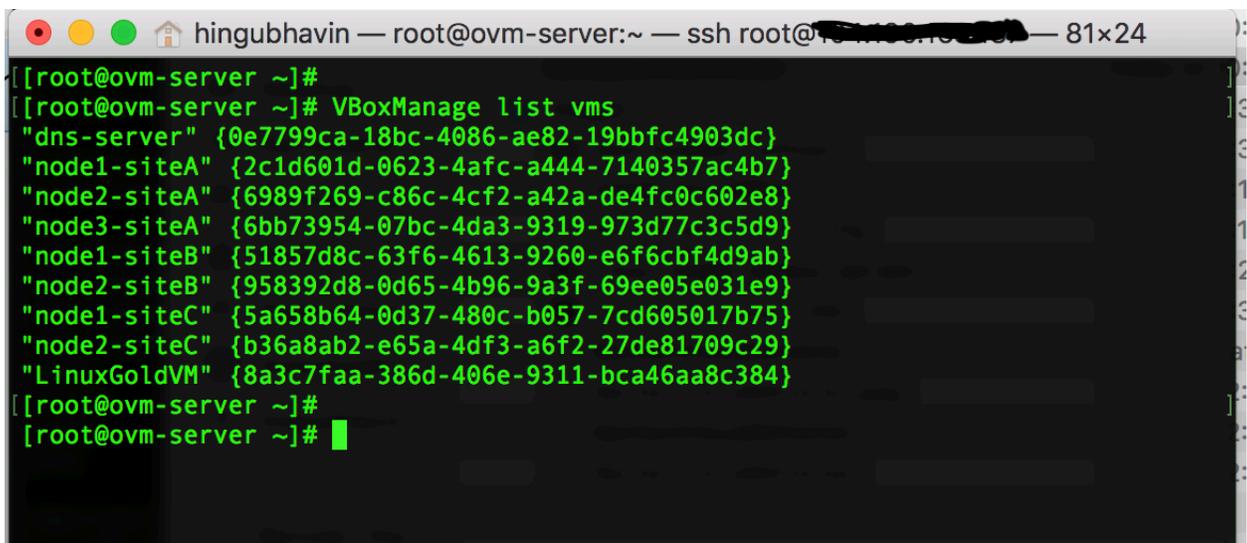

After fully provisioning the first VM, I created the subsequent VMs by cloning the node1-siteA VM as shown below.

```
VBoxManage clonevm node1-siteA --name node2-siteA --basefolder
/u01/guestVMs --register
VBoxManage clonevm node1-siteA --name node3-siteA --basefolder
/u01/guestVMs --register
VBoxManage clonevm node1-siteA --name node1-siteB --basefolder
/u01/guestVMs --register
VBoxManage clonevm node1-siteA --name node2-siteB --basefolder
/u01/guestVMs --register
VBoxManage clonevm node1-siteA --name node1-siteC --basefolder
/u01/guestVMs --register
VBoxManage clonevm node1-siteA --name node2-siteC --basefolder
/u01/guestVMs --register
```

I had to make the below network changes in the cloned VM in order for it to join the LAN network:

- Update the ifcfg-eth0 file with (a) new HWADDR of NIC (ifconfig -a | grep eth0 gives you the HWADDR), (b) remove the UUID, (c) change the IPADDR to one that is new and not allocated to any devices.
- Update the network file with the new hostname.
- Update the /etc/udev/rules.d/70-persistent-net.rules and to assign right HWADDR for eth0 and remove rest of the HWADDR lines from there.
- Reboot the VM.

Here is the List of the VMs that I have created in my Cloud system.

```
hingubhavin — root@ovm-server:~ — ssh root@... — 81x24
[[root@ovm-server ~]#
[[root@ovm-server ~]# VBoxManage list vms
"dns-server" {0e7799ca-18bc-4086-ae82-19bbfc4903dc}

[[root@ovm-server ~]#
[[root@ovm-server ~]# █
```

To get the detailed information of any VMs in the Cloud, I use

```
VBoxManage showvminfo 'node1-siteA'
```

## Start the guest VMs:

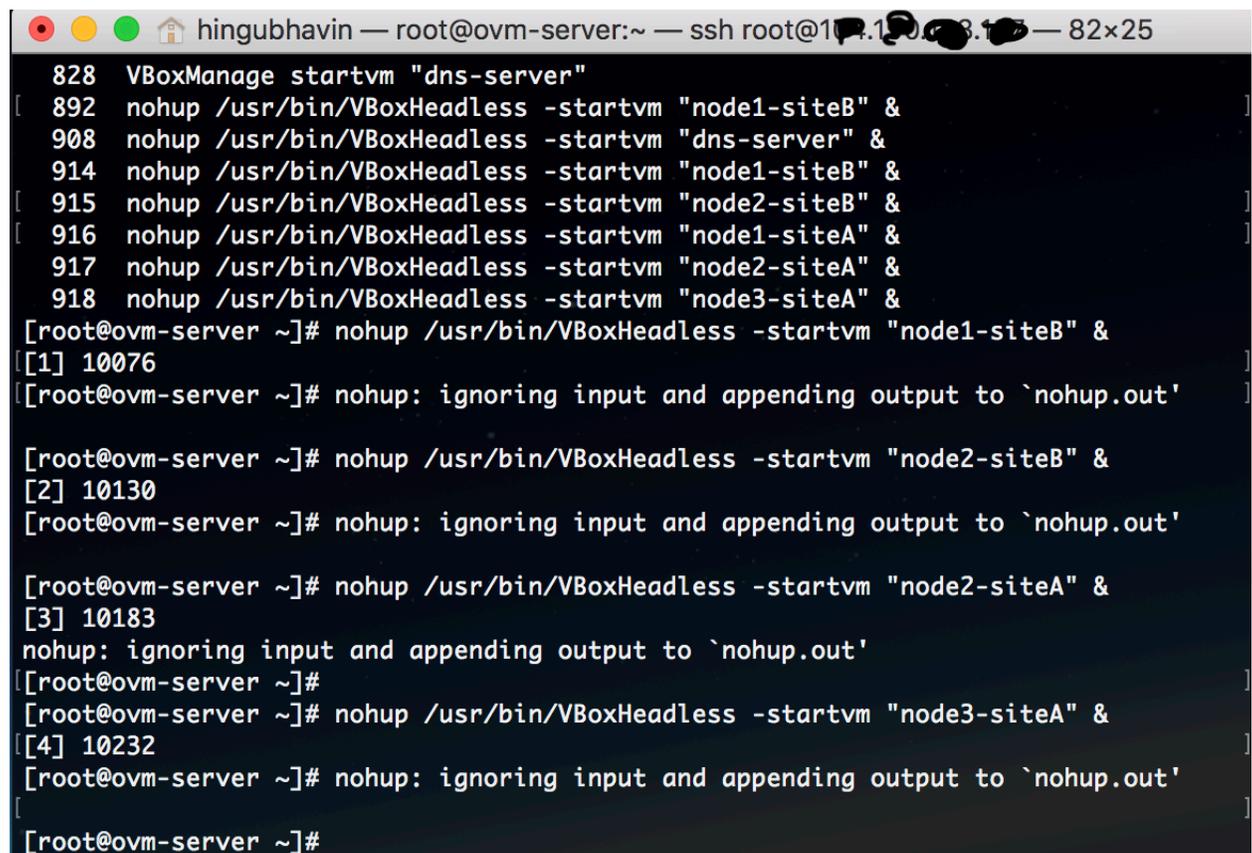

After Installing Oracle software on these VMs, I decided to check the load on the VM host (ovm-server) with all the VMs up and running. Also, at this point, I was ready to configure the DMZ in the ISP router and test the remote accessibility to the Cloud System at home.

```
nohup /usr/bin/VBoxHeadless -startvm "dns-server" &
nohup /usr/bin/VBoxHeadless -startvm "node1-siteB" &
nohup /usr/bin/VBoxHeadless -startvm "node2-siteB" &
nohup /usr/bin/VBoxHeadless -startvm "node1-siteA" &
```

```
nohup /usr/bin/VBoxHeadless -startvm "node2-siteA" &  
nohup /usr/bin/VBoxHeadless -startvm "node3-siteA" &  
nohup /usr/bin/VBoxHeadless -startvm "LinuxGoldVM" &
```

Get the status of the VMs

```
VBoxManage showvminfo 'dns-server' | grep State  
VBoxManage showvminfo 'node1-siteA' | grep State  
VBoxManage showvminfo 'node2-siteA' | grep State  
VBoxManage showvminfo 'node3-siteA' | grep State  
VBoxManage showvminfo 'node1-siteB' | grep State  
VBoxManage showvminfo 'node2-siteB' | grep State  
VBoxManage showvminfo 'LinuxGoldVM' | grep State
```

```
hingubhavin — root@ovm-server:~ — ssh root@192.168.1.103 — 82x25  
828 VBoxManage startvm "dns-server"  
892 nohup /usr/bin/VBoxHeadless -startvm "node1-siteB" &  
908 nohup /usr/bin/VBoxHeadless -startvm "dns-server" &  
914 nohup /usr/bin/VBoxHeadless -startvm "node1-siteB" &  
915 nohup /usr/bin/VBoxHeadless -startvm "node2-siteB" &

VM host – Resource Utilization Status:

The screenshot shows a TigerVNC System Monitor window with the following data:

CPU	Usage
CPU1	19.2%
CPU2	25.3%
CPU3	15.8%
CPU4	35.7%
CPU5	32.7%
CPU6	26.9%
CPU7	19.2%
CPU8	9.2%
CPU9	61.4%
CPU10	12.1%
CPU11	2.0%
CPU12	4.0%

Resource	Usage	Total
Memory	38.1 GiB (30.3%)	125.6 GiB
Swap	0 bytes (0.0%)	8.4 GiB

Metric	Value
Receiving	4.8 KiB/s
Total Received	1.5 GiB
Sending	271.2 KiB/s
Total Sent	413.6 MiB

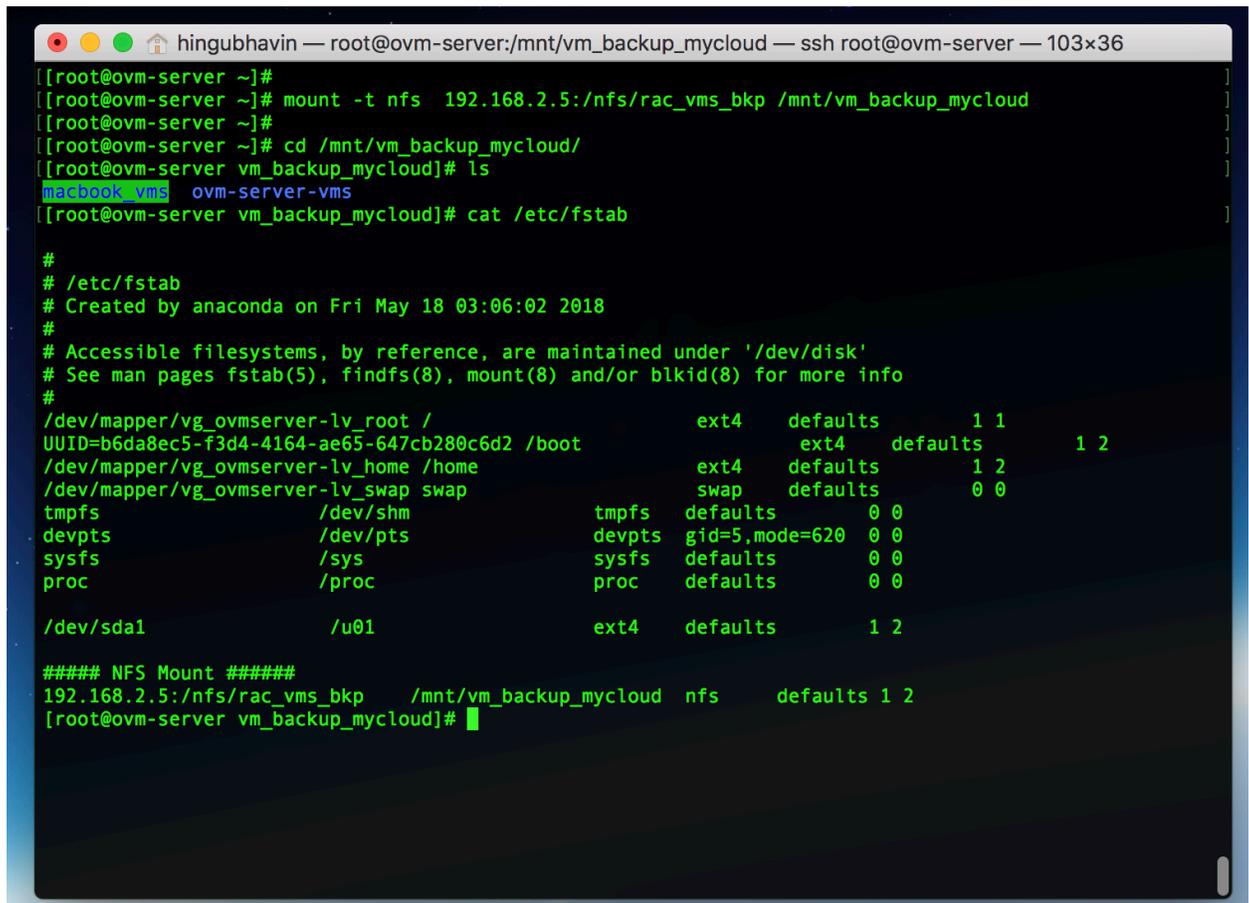

## Setting up the Backup Server for Guest VMs:

Backing up the VMs is simply copying their VDI files to the backup media. Here, I took an advantage of existing NAS storage (MyCloud PR4100 from WD) to treat it like a backup server for the guest VMs. After carving out a 1TB LUN on the 24TB NAS presenting it to the VM host (ovm-server), it became ready for me to start backing up the VMs.

The screenshot displays the 'Set Up Shares' configuration page in the MyCloud PR4100 web interface. The browser address bar shows '192.168.2.5'. The navigation menu includes Home, Users, Shares, Apps, Cloud Access, Backups, Storage, and Settings. The 'Set Up Shares' section is active, showing a file browser on the left with 'rac\_vms\_bkp' selected. The 'Share Profile' section is configured with 'Volume\_1' as the volume, 'rac\_vms\_bkp' as the share name, and 'for backup of guest VMs' as the description. The 'Public' checkbox is turned OFF, as are 'Recycle Bin' and 'Media Serving'. 'Oplocks' are turned ON. The usage is 635G. The 'Share Access' section shows 'FTP Access' and 'WebDAV Access' turned OFF, and 'NFS Access' turned ON. A 'Mount Point: nfs://192.168.2.5/nfs/rac\_vms\_bkp' is displayed and circled. The 'User Access' section shows 'admin' with 'Read / Write' permissions.

```
mount -t nfs 192.168.2.5:/nfs/rac_vms_bkp /mnt/vm_backup_mycloud
```

added this to the /etc/fstab for auto mount during the system startup.

```
hingubhavin — root@ovm-server:/mnt/vm_backup_mycloud — ssh root@ovm-server — 103x36
[[root@ovm-server ~]#
[[root@ovm-server ~]# mount -t nfs 192.168.2.5:/nfs/rac_vms_bkp /mnt/vm_backup_mycloud
[[root@ovm-server ~]#
[[root@ovm-server ~]# cd /mnt/vm_backup_mycloud/
[[root@ovm-server vm_backup_mycloud]# ls
macbook_vms ovm-server-vms
[[root@ovm-server vm_backup_mycloud]# cat /etc/fstab

#
# /etc/fstab
# Created by anaconda on Fri May 18 03:06:02 2018
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#

[[root@ovm-server vm_backup_mycloud]#
```

## Accessing the Cloud Remotely:

At this point, I was ready to modify the ISP (AT&T) router to setup the DMZ to forward the inbound connection request to the proxy-server only for certain ports like, 22 (ssh) and ports for VNC servers (5901 – 6101).

Here is what my router setting looks like after making the specified changes.

The screenshot shows a web browser window with the address bar displaying '192.168.2.254'. The page has a navigation menu with 'Home', 'Services', 'Settings', and 'Site Map'. Below this is a sub-menu with 'System Info', 'Broadband', 'LAN', 'Firewall', 'Logs', and 'Diagnostics'. The 'Firewall' section is active, showing 'Status', 'Applications, Pinholes and DMZ', 'Advanced Configuration', and 'Firewall Rules'. The 'Status' sub-section is selected, displaying 'Firewall Status' and 'Firewall Active'. A message states: 'The firewall actively blocks access of unwanted activity from the Internet.' Below this, it says 'Current Applications, Pinholes and DMZ Settings: Custom'. The 'Allowed Application Lists' section contains a table with the following data:

Device	Allowed Applications	Application Type	Protocol	Port Number(s)	Public IP
proxy-server	SSH Server	-	tcp	22	104.168.168.17
	XVNC	-	tcp	5901-6101	104.168.168.17

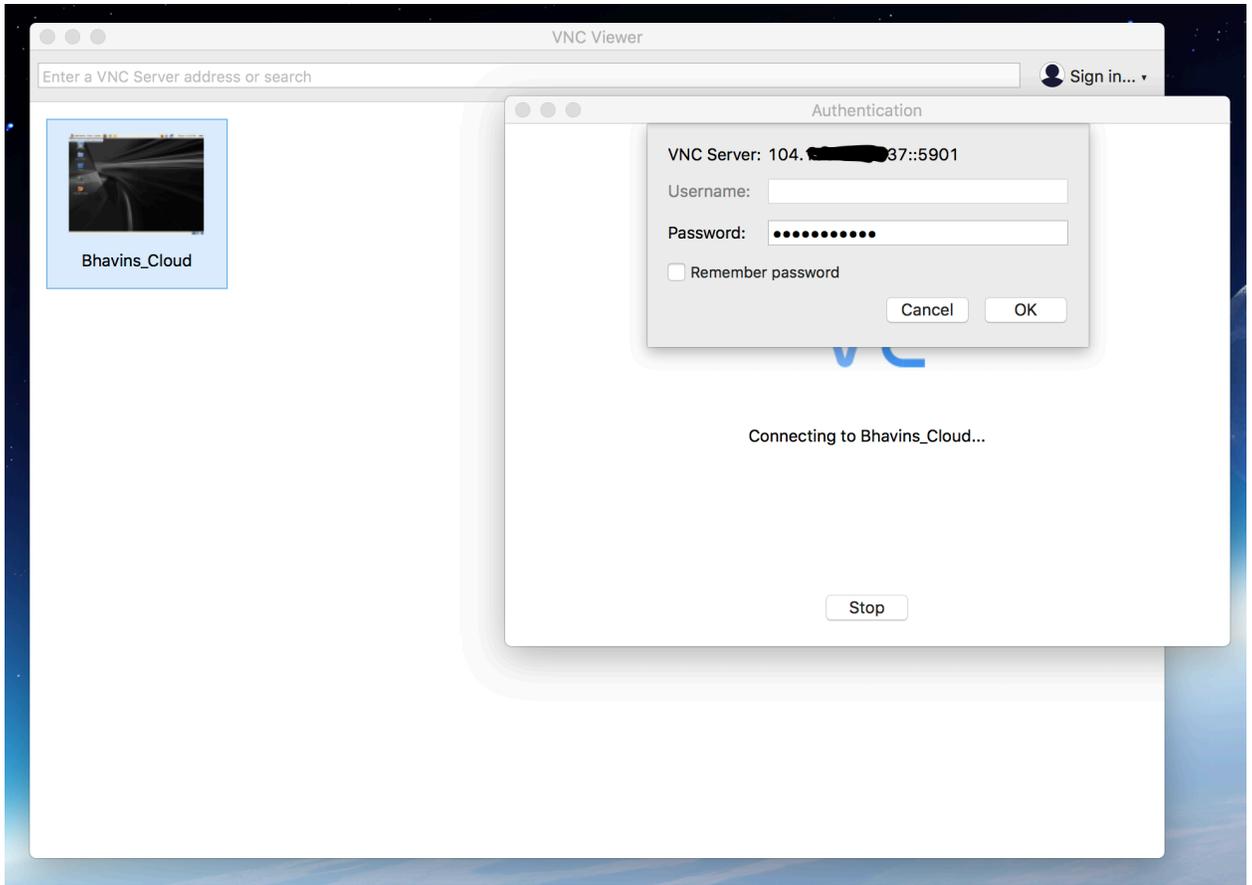

Time to test the connectivity using Public Address of the Route:

```
hingubhavin — root@ovm-server:~ — ssh root@104.1[REDACTED]37 — 80x27
[Bhavins-MBP2:~ hingubhavin$
[Bhavins-MBP2:~ hingubhavin$ ssh root@104.1[REDACTED]37
[root@104.190.163.137's password:
Last login: Thu Jun 7 23:46:27 2018 from 192.168.2.254
[[root@proxy-server ~]# hostname
proxy-server.hingu.net
[[root@proxy-server ~]# nslookup ovm-server.hingu.net
Server:          192.168.2.15
Address:         192.168.2.15#53

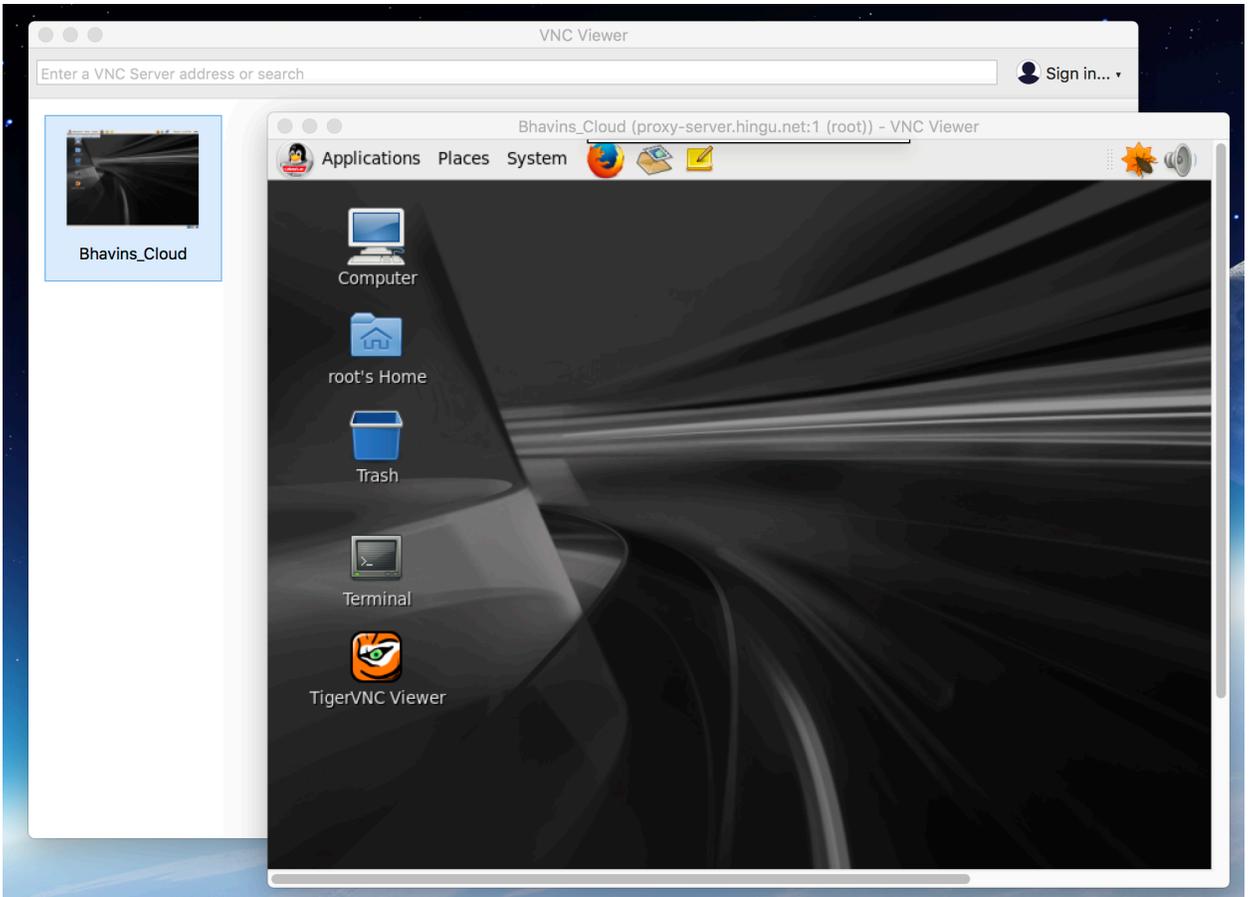

Name:   ovm-server.hingu.net
Address: 192.168.2.2

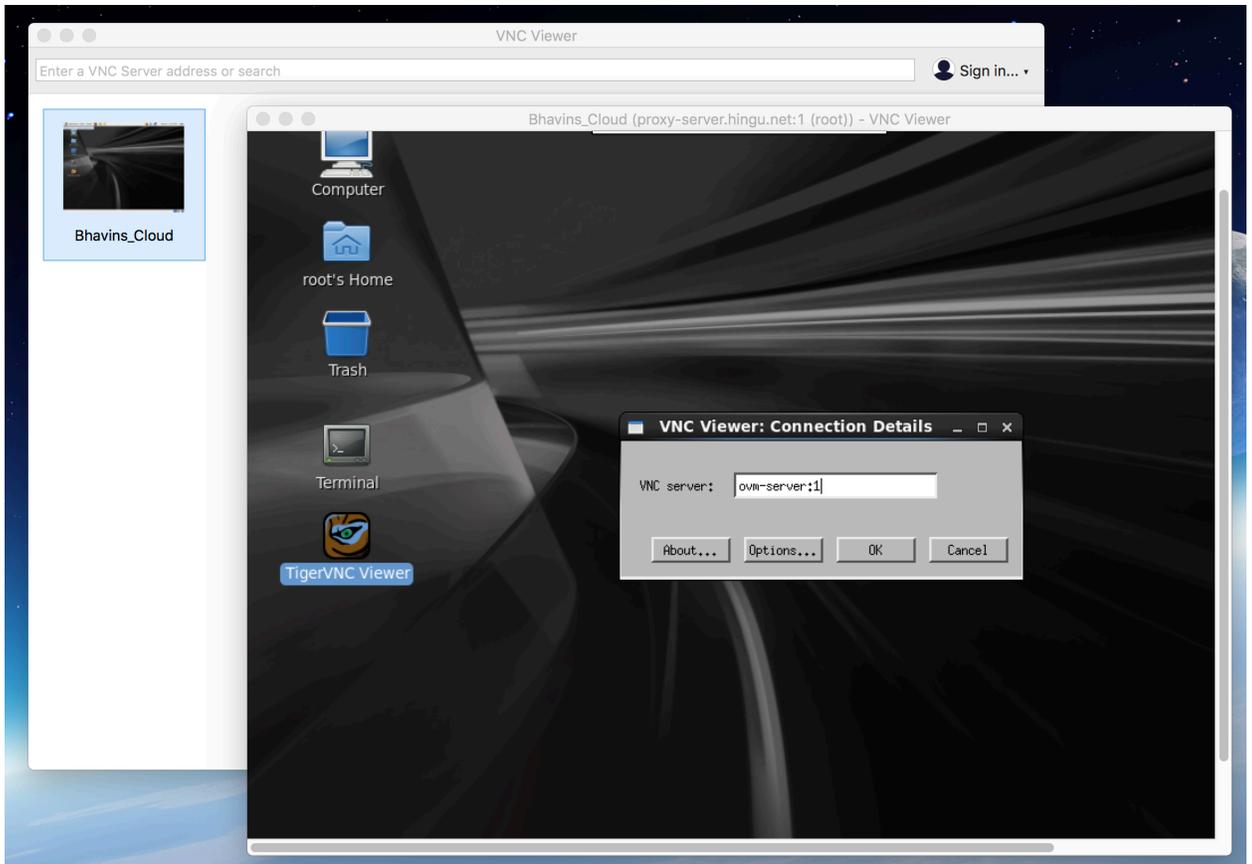

[[root@proxy-server ~]# ssh ovm-server
[root@ovm-server's password:
Last login: Thu Jun 7 18:29:10 2018 from proxy-server.hingu.net
[[root@ovm-server ~]# VBoxManage list vms
"dns-server" {0e7799ca-18bc-4086-ae82-19bbfc4903dc}

[root@ovm-server ~]#
```

Using VNC:

Connected to the proxy-server on X-Desktop. I could use TigerVNC on proxy-server to connect to any of the Linux guest VMs or ovm-server in I need to run any X application. Generally, I prefer install all my Oracle software using silent mode through my automation scripts but in case if I ever want to use X-windows, VNCViewer could be very handy.

## Summary:

So, in the Amazon's terminology. I can say that I have created my own VPC at home from ground up. The storage subsystem that I have used here is what Amazon referred to as S3 (2TB local mount /u01 for the database storage and VDI files for VMs). The guest VMs are my Amazon EC2 instances and the dns server that I setup to resolve "hingu.net" private domain in my LAN is my Private DNS. The NFS mount that I created using the 1TB LUN carved out of NAS storage and is shared across all the VMs is referred to as Amazon EFS.
